## QuickPoll

### Dental Resorption

Tooth resorption has been thought to be a fairly uncommon process by which normal tissue cells are activated to begin osteoclastic activity. Individual teeth can be lost or compromised as a result.

Several etiologies have been identified: trauma, orthodontic forces, bruxism, and internal tooth bleaching, as well as cases where there is no known identifiable etiology.

What has been your experience regarding resorption in your patients? The results of this 5-question poll will help determine whether this issue merits further investigation by the Network.
